Sonifex remote extender

The Redbox RB-IPE IP Extender for GPIO and analogue control signals is a 1U designed to provide remote control over an Ethernet network. Configured using a built-in web server, two units can control each other across Ethernet or a single unit can be controlled via Ethernet and the web server interface.

The CM-CU1 Single Commentator Unit provides a commentator position with a line-level input and has an individual commentator output, with an additional output providing a mix of commentator and line input audio. The line input can be configured to remain present at the mix output even if the commentator is off air, making it useful for routing crowd effects or prerecorded material to the programme feed.

The CM-TB8 8 Channel Talkback Control Unit is a self-contained communications unit allowing multiple 4-wires and IFBs in a 1U. It offers connection to any industry standard talkback system including the Sonifex CM-TLL line listen unit plus the CM-CU1 and CM-CU21 commentator units.
