

DHY-04V Beta Firmware Release Notes – v1.24 (Pre-release)

Release Date: 28 April 2026

Status: Beta / Pre-release (for testing purposes)

Changes in v1.24

- Improved TX audio compatibility with different mobile network operators.
- Adjusted gain structure in the TX path to provide more consistent audio levels when used with various VoLTE networks.
- Addressed reported cases of distorted audio being received by the remote caller on certain mobile networks.

Notes:

Mobile network operators implement different audio processing, level normalisation, and VoLTE handling. This beta release contains adjustments aimed at improving interoperability and reducing distortion on networks that showed issues in previous versions.

We recommend customers test this firmware on their specific network and report back on both RX and TX audio quality. The previous stable release (v1.23) remains available for those who prefer not to use the beta version.

Important:

This is a pre-release firmware. It should be used for evaluation only. Please provide feedback to technical.support@sonifex.co.uk.
